

# Part IV: Mining Entity Structures: Taxonomy and Knowledge Base Construction

EDBT 2023 Tutorial: Mining Structures from Massive Texts by Exploring the Power of Pretrained Language Models Yu Zhang, Yunyi Zhang, Jiawei Han Department of Computer Science, University of Illinois at Urbana-Champaign Mar 29, 2023

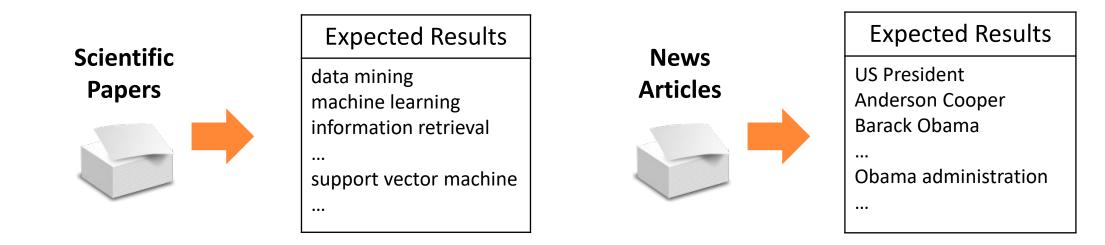

### Outline

Phrase Mining

- UCPhrase: Unsupervised Context-aware Quality Phrase Tagging [KDD'21]
- Named Entity Recognition
- Taxonomy Construction
- Relation Extraction and Knowledge Graph Construction

# Why Phrase Mining?

Identifying and understanding quality phrases from context is a fundamental task in text mining.

Quality phrases refer to informative multi-word sequences that "appear consecutively in the text, forming a complete semantic unit in certain contexts or the given document" [1].

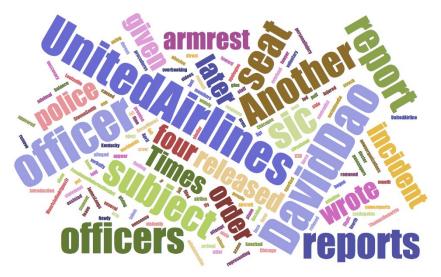

[1] Geoffrey Finch. 2016. Linguistic terms and concepts. Macmillan International Higher Education

# Why Phrase Mining?

w/o phrase mining

- What's "United"?
- Who's "Dao"?
- Applications in NLP, IR, Text Mining
  - Text Classification
  - Indexing in search engine

### w/ phrase mining

- United Airline!
- David Dao!
- Keyphrases for topic modelingText Summarization

## **Previous Phrase Mining/Chunking Models**

- □ Statistics-based models (*TopMine, SegPhrase, AutoPhrase*)
  - only work for frequent phrases, ignore valuable infrequent / emerging phrases
- Tagging-based models (Spacy, StanfordNLP)
- do not have requirements for frequency
- require expensive and unscalable sentence-level annotations for model training

## **Framework of UCPhrase**

#### Silver Label Generation + Attention Map-based Span Prediction

#### **Core Phrases for Silver Labels**

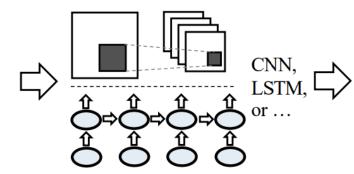

unsupervised, per-document, could have noise (e.g., "cities including")

The [heat island effect] is from ... The term heat island is also used ... [heat island effect] is found to be ...

... like other [cities including] [New York]... happens in [cities including] ... about [New York]. Sentence Attention Maps no fine-tuning, one-pass only, captures the sentence structure like other cities New

Pre-trained Transformer LM

#### Train a Lightweight Classifier core phrases vs. random negatives

#### Final Tagged Quality Phrases

both frequent & uncommon phrases could correct noise from silver labels

The [heat island effect] is from ... The term [heat island] is also used ... [heat island effect] is found to be ...

... like other cities including [New York] ... happens in cities including ... about [New York].

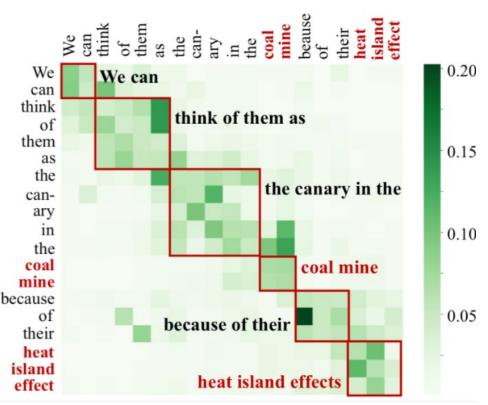

## **Silver Label Generation**

How do human readers accumulate new phrases?

- even without any prior knowledge we can recognize these consistently used patterns from a document
- e.g., task name, method name, dataset name, concepts in a publication
- e.g., human name, organization, locations in a news article
- Mining core phrases as silver labels
  - independently mine **max word sequential patterns** within each document
  - with each document as context
    - preserve contextual completeness ("biomedical data mining" vs. "data mining")
    - avoid potential noises from propagating to the entire corpus

# **Attention Map as Surface-Agnostic Feature**

- Good features for phrase recognition should be
  - agnostic to word surface names (so the model cannot rely on rigid memorization)
  - focusing on sentence structure rather than phrase names
- Extract knowledge directly from a pre-trained language model
  - the attention map of a sentence vividly visualizes its inner structure
  - high quality phrases should have distinct attention
     patterns from ordinary spans
- Phrase Tagging as Image Classification
  - train a lightweight 2-layer CNN model for binary classification: is a phrase or not

## **Quantitative Evaluation**

Table 2: Evaluation results (%) of three tasks for all compared methods on datasets on two domains.

|                        | Method Name      | Task I: Phrase Ranking |       |         |       | Task II: KP Extract. |                   |         | Task III: Phrase Tagging |       |      |   |         |      |       |
|------------------------|------------------|------------------------|-------|---------|-------|----------------------|-------------------|---------|--------------------------|-------|------|---|---------|------|-------|
| Method Type            |                  | KP20k                  |       | KPTimes |       | KP20K                |                   | KPTimes |                          | KP20k |      | κ.  | KPTimes |      | es    |
|                        |                  | P@5K                   | P@50K | P@5K    | Р@50К | Rec.                 | F <sub>1@10</sub> | Rec.    | F <sub>1@10</sub>        | Prec. | Rec. | $F_1$   | Prec.   | Rec. | $F_1$ |

## Outline

- Phrase Mining
- Named Entity Recognition (NER)

- Few-shot NER and Entity Typing
- Few-Shot Fine-Grained Entity Typing with Automatic Label Interpretation and Instance Generation [KDD' 2022]
- **Distantly-supervised NER**
- **Taxonomy Construction**
- Relation Extraction and Knowledge Graph Construction

# **Named Entity Recognition (NER)**

- □ A **named entity** typically refers to a sequence of words that correspond to a specific entity in the real world (i.e., an entity with a *name*) (e.g., *"Bill Clinton"*)
- Named-entity recognition (NER) is a subtask of information extraction (IE) that seeks to locate and classify named entities in text into pre-defined categories
  - Given a sentence, NER is to first *segment which words are part of entities*, and then *classify each entity by type* (person, organization, location, and so on)
  - Example
    - □ Input: Jim bought 300 shares of Acme Corp. in 2006
    - □ Output: [Jim]<sub>Person</sub> bought 300 shares of [Acme Corp.]<sub>Organization</sub> in [2006]<sub>Time</sub>
- Most NER methods focus on three types of entities: *person, location,* and *organization. Some also include dates, times, monetary values,* and *percentages* Also, *biological entities* (in bio-domain), or *product names* (for online advertising)

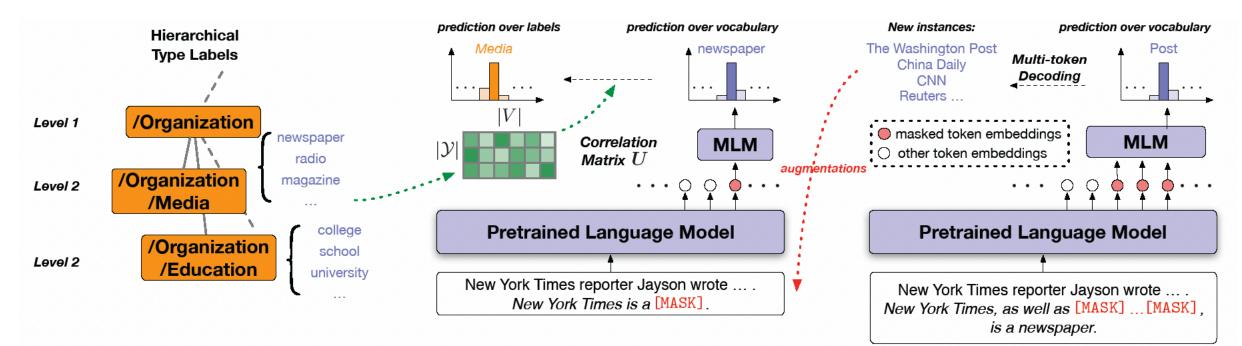

## Motivation

- Deep neural models have achieved enormous success for NER
- However, a common bottleneck of training deep learning models is the acquisition of abundant high-quality human annotations
- Few-shot NER learns to transfer to new domains/categories with only a few training examples.

## Limitations of current pipeline

- Current approaches have not fully utilized the power of PLMs
- **representation** models that predict entity types based on entity instance representations
- the generation power of PLMs acquired through extensive generaldomain pretraining can be exploited to generate new entity instances
  - model can be trained with more instances for better generalization

#### Overall Framework of ALIGNIE (Automatic Label Interpretation and Generating New Instance for Entity typing)

**Entity Type Interpreter** 

(Left): With a given type label hierarchy, an entity type interpretation module relates all the words in the vocabulary with the label hierarchy by a correlation 14 matrix.

(Middle): An entity typing classifier maps the word probability at the [MASK] position to type probability using the correlation matrix.

Entity Type Classifier

#### **Contextualized Instance Generator**

(Right): A type-based contextualized instance generator uses an entity mention and its predicted type to construct a template for new instance generation to augment the training set.

## **PLM-based Instance Generator**

E.g., a *newspaper* entity "New York Times"

more newspaper names

Generation Template :

[Context]. New York Times, as well as [MASK] [MASK] [MASK], is a *newspaper*. Entity Mention # ranges from Predicted by

# ranges from1 to the length oforiginal entity mention

Predicted by Entity Type Classifier

## **Multi-Token Instance Generation**

We randomly choose one [MASK] token at each step, and sample from its output token probability to fill in a word.

New York Times, as well as the  $_1$  [MASK] [MASK] is a newspaper. E.g. New York Times, as well as the  $_1$  Washington  $_2$  [MASK] is a newspaper. New York Times, as well as the  $_1$  Washington  $_2$  Post  $_3$  is a newspaper. The next blank to be filled in is randomly selected, therefore the order is not always from left to right.

Score(
$$\widetilde{\boldsymbol{m}}$$
) =  $\sum_{i=1}^{|\widetilde{\boldsymbol{m}}|} \log(s_i)$ 

The conditional probability at each step

### Generated New instances based on predicted types of example entities

#### Multi-token instances

| Generation from <b>multi-token</b> entities  |                    |   |  |  |  |  |  |  |  |
|--|--------------------|---|--|--|--|--|--|--|--|
| Context & entity mention   | MLM predicted type | Generated new instances   |  |  |  |  |  |  |  |
| The album also included the song "Vivir Lo Nuestro,"<br>a duet with <b>Marc Anthony</b> .  | singer             | Beyonce, Jennifer Lopez,<br>Rihanna, Taylor Swift,<br>Lady Gaga, Michael Jackson,   |  |  |  |  |  |  |  |

| ALIGNIE (- hierarchical reg.) | 52.74     | 77.55      | 79.72      | 72.15  | 80.35      | 80.40      | 59.01  | 70.91      | 70.91      |  |  |
| ALIGNIE (- new instances)     | 51.10     | 72.91      | 76.88      | 73.50  | 81.62      | 81.31      | 57.41  | 69.47      | 69.47      |  |  |
| ALIGNIE                       | 53.37     | 77.21      | 80.68      | 75.44  | 82.20      | 82.30      | 59.72  | 71.90      | 71.90      |  |  |
| Fully Supervised Setting      |           |            |            |        |            |            |        |            |            |  |  |
| Fine-tuning                   | 56.70     | 75.21      | 78.86      | 78.06  | 82.39      | 82.60      | 79.75  | 85.74      | 85.74      |  |  |
| Prompt-based MLM              | 55.18     | 74.57      | 77.47      | 77.10  | 81.77      | 82.05      | 77.38  | 85.22      | 85.22      |  |  |

- Prompt-based results have higher performance than vanilla fine-tuning in few-shot settings. In fully supervised settings, however, fine-tuning performs a little better than prompt-based MLM.
- ALIGNIE can even outperform fully supervised setting on OntoNotes and BBN, but cannot on Few-NERD. This is because the training set of OntoNotes and BBN are automatically inferred from external knowledge bases, and can contain much noise.

### Outline

- Phrase Mining
- Named Entity Recognition (NER)
  - Few-shot NER
  - Distantly-supervised NER

- Taxonomy Construction
- Relation Extraction and Knowledge Graph Construction

## Challenge

- The biggest challenge of distantly-supervised NER is that the distant supervision may induce incomplete and noisy labels, because
  - the distant supervision source has limited coverage of the entity mentions in the target corpus
  - some entities can be matched to multiple types in the knowledge bases--such **ambiguity** cannot be resolved by the context-free matching process
- Straightforward application of supervised learning will lead to deteriorated model performance, as neural models have the strong capacity to fit to the given (noisy) data

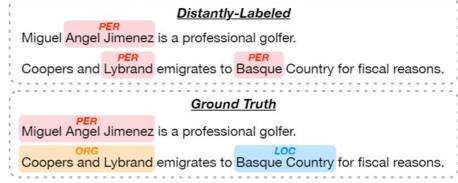

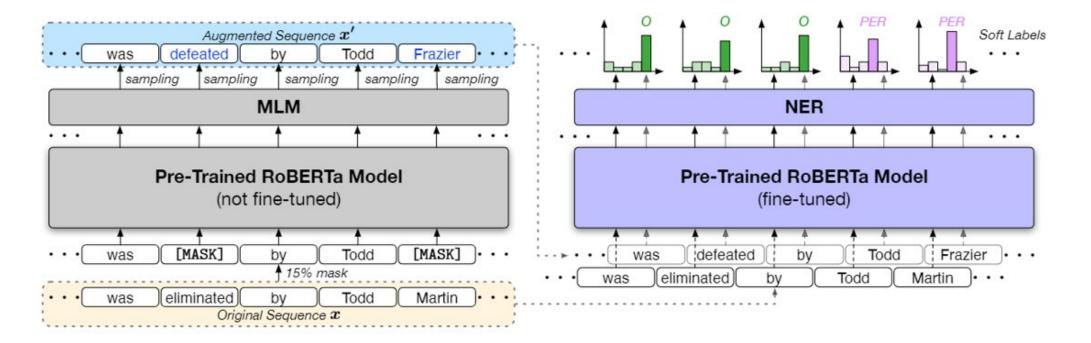

Figure 1: Distant labels obtained with knowledge bases may be incomplete and noisy, resulting in wronglylabeled tokens.

### RoSTER

RoSTER: Distantly-Supervised Named Entity Recognition with Noise-Robust Learning and Language Model Augmented Self-Training [EMNLP'21]

## Method

- Noise-Robust Learning: Why straightforward application of supervised NER learning on noisy data is bad?
- When the labels are noisy, training with the Cross Entropy (CE) loss can cause overfitting to the wrongly-labeled tokens
- Generalized Cross Entropy Loss (GCE)

$$\mathcal{L}_{\text{GCE}} = \sum_{i=1}^{n} w_i \frac{1 - f_{i,y_i}(\boldsymbol{x}; \boldsymbol{\theta})^{1-q}}{1-q} \qquad w_i = \mathbb{1}\left(f_{i,y_i}(\boldsymbol{x}; \boldsymbol{\theta}) > \tau\right) \qquad \begin{array}{l} \text{Only use reliable labels} \\ \text{(model prediction agrees)} \end{array}$$

Rationale: Since our loss function is noise-robust, the learned model will be dominated by the correct majority in the distant labels instead of quickly overfitting to label noise; if the model prediction disagrees with some given labels, they are potentially wrong

## Method

- Contextualized Augmentations with PLMs
- □ Randomly mask out 15% of tokens in the original sequence
- □ Feed the partially masked sequence into the pre-trained RoBERTa model
- Augmented sequence is created by sampling from the MLM output probability for each token
- Further enforce the label-preserving constraint:
- □ sample only from the top-5 terms of MLM outputs
- if the original token is capitalized or is a subword, so should the augmented one

## **Experiment Results**

## Outline

- Phrase Mining
- Named Entity Recognition
- Taxonomy Construction
  - **Taxonomy Basics and Construction**
  - Set Expansion
  - Taxonomy Construction (with Minimal User Guidance)
  - Taxonomy Expansion & Enrichment
- Relation Extraction and Knowledge Graph Construction

## What Is Taxonomy?

- Taxonomy is a hierarchical (or DAG) organization of concepts
  - Ex.: Wikipedia category, ACM CCS Classification System, Medical Subject Heading (MeSH), Amazon Product Category, Yelp Category List, WordNet, ...

## Why Do We Need Taxonomy?

- Taxonomy can benefit many knowledge-rich applications
  - Text Understanding
  - **Knowledge Organization**
  - **Document Categorization**
  - **Recommender System**

TPU

Corpus

**Multi-dimensional Corpus Index** 

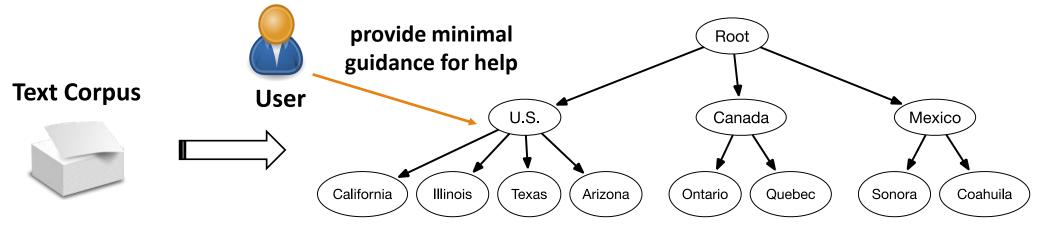

2018

## How to Get Taxonomy: Manual vs. Automated?

- Manual Curation
  - Time-consuming
  - Tremendous <u>human (experts) efforts</u>
  - Examples
    - Medical Subject Heading (MeSH): 60+ years
    - □ ACM CCS Classification System: 40+ years
    - IEEE Taxonomy: 40+ years

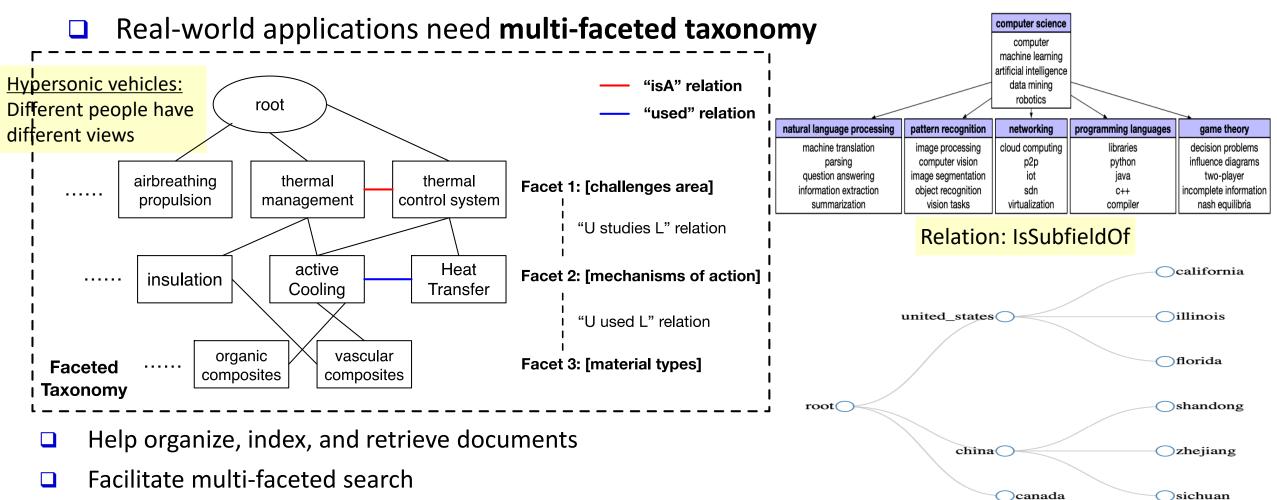

Automated taxonomy construction/enhancement from **text** is in great demand

## **Multi-Faceted Taxonomy**

One facet only reflects a certain kind of relation between parent and child nodes

Relation: IsLocatedIn

Conduct analysis at meaningful levels of abstraction

## **Issues Related to Taxonomy Construction**

#### Set Expansion

- Given a few seeds as a set, find other items and expand the set
- □ For example, given {*Illinois*, *Maryland*}, derive all U.S. states
- **Taxonomy Construction (with Minimal User Guidance)** 
  - User give a seed skeleton taxonomy (in a small scale) and text corpus to build a taxonomy organized by certain relations
- Taxonomy Expansion & Enrichment
  - Update an already constructed taxonomy by adding new items on the existing taxonomy

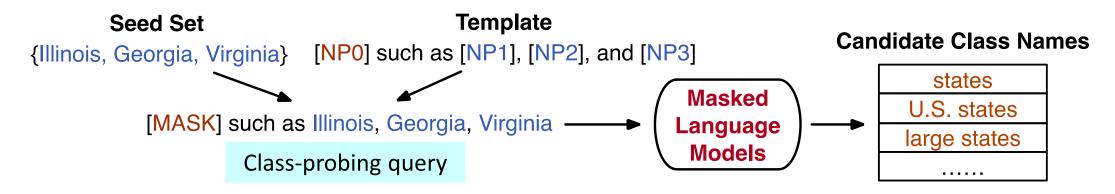

### Outline

#### Phrase Mining

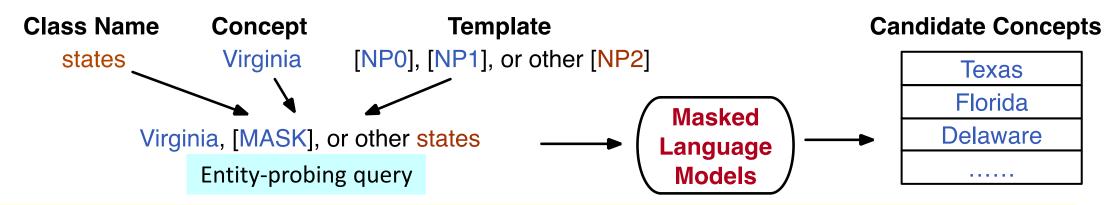

- Named Entity Recognition
- Taxonomy Construction
  - Taxonomy Basics and Construction
  - Set Expansion
  - Taxonomy Construction (with Minimal User Guidance)
  - Taxonomy Expansion & Enrichment
- Relation Extraction and Knowledge Graph Construction

## **CGExpan: Probing Language Model for Guidance**

Generating the **target class names** by probing a language model

Preventing concept drifting with <u>Class Guided Expansion (CGExpan)</u>

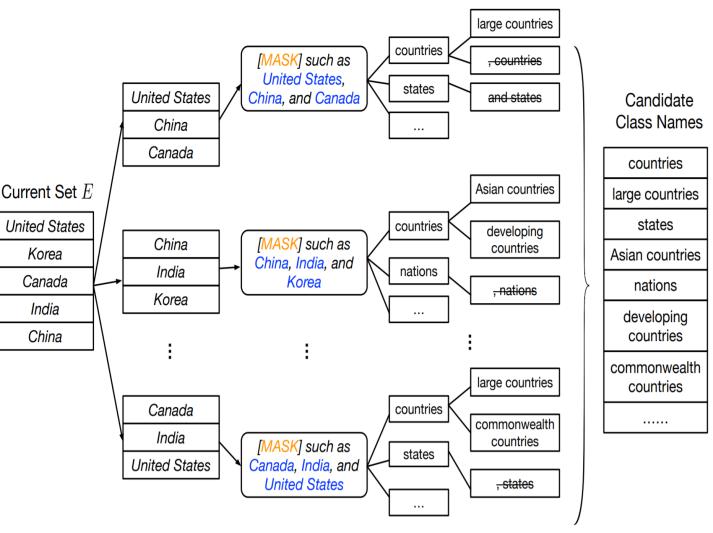

Yunyi Zhang, Jiaming Shen, Jingbo Shang, Jiawei Han, "Empower Entity Set Expansion via Language Model Probing", ACL'20

## **CGExpan 1: Class-Name Generation**

#### **Class name generation:**

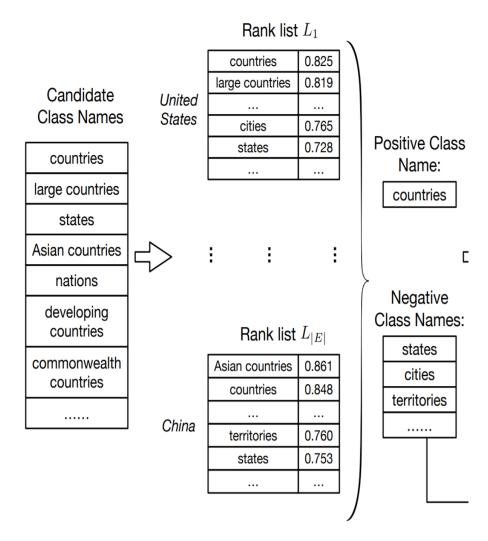

- Iteratively submit <u>class-probing</u> <u>queries</u> to a language model to get multi-gram class names
- Repeat the process by randomly sampling entities
- Keep all generated class names that are noun phrases

## **CGExpan 2: Class-Name Ranking**

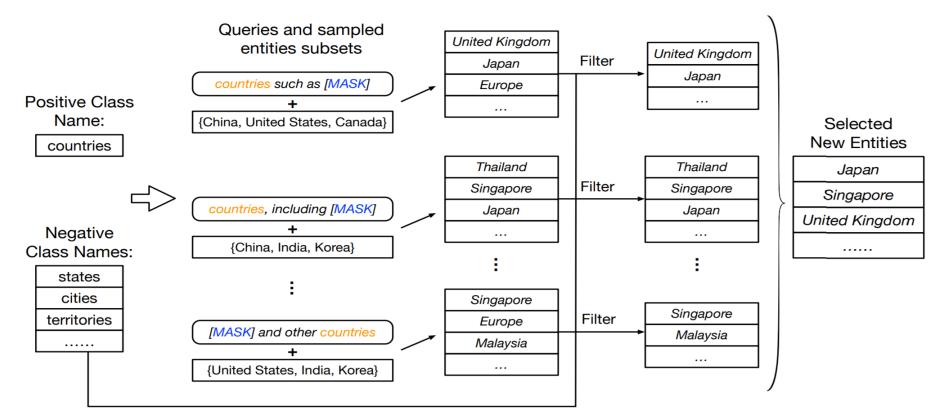

#### **Class name ranking:**

- Build <u>entity-probing queries</u> for each candidate class
- Compare the retrieved results with seed set to score each class name
- Rank the class names: select one best class name and several negative ones

## **CGExpan 3: Class-Guided Entity Selection**

- **Class-guided entity selection** (by Rank ensemble)
  - Retrieve and score entities (including those currently in the expanded set) based on <u>entity probing queries</u> and selected class names
  - Select top-rank entities to expand the set

## **CGExpan: Quantitative Results**

|                              | Methods                                 | Wikip  | oedia  | APR    |        |  |

MAP@K: Mean Average Precision truncated at position K

- vs. Bootstrapping: better address the concept drifting issue
- vs. One time text ranking: better leverage seed supervision iteratively

**Wikipedia**: 1.5M Wikipedia article sentences (20 semantic classes manually labeled for evaluation); **APR**: 1.1M news article sentences (40 semantic classes manually labeled for evaluation)

### **FGExpan: Fine-Grained Set Expansion**

- **Expanding entity sets at the finest possible granularity on a type taxonomy**
- E.g., If the seeds are all African countries, then we should not add countries on other continents into the expanded set

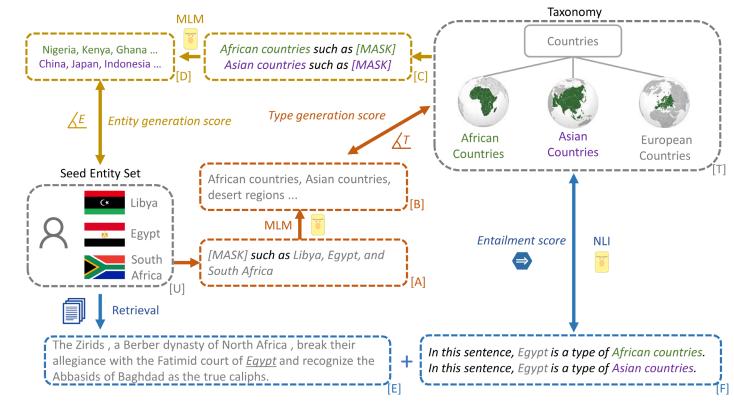

Jinfeng Xiao, Mohab Elkaref, Nathan Herr, Geeth De Mel, and Jiawei Han. "Taxonomy-Guided Fine-Grained Entity Set Expansion" SDM'23

37

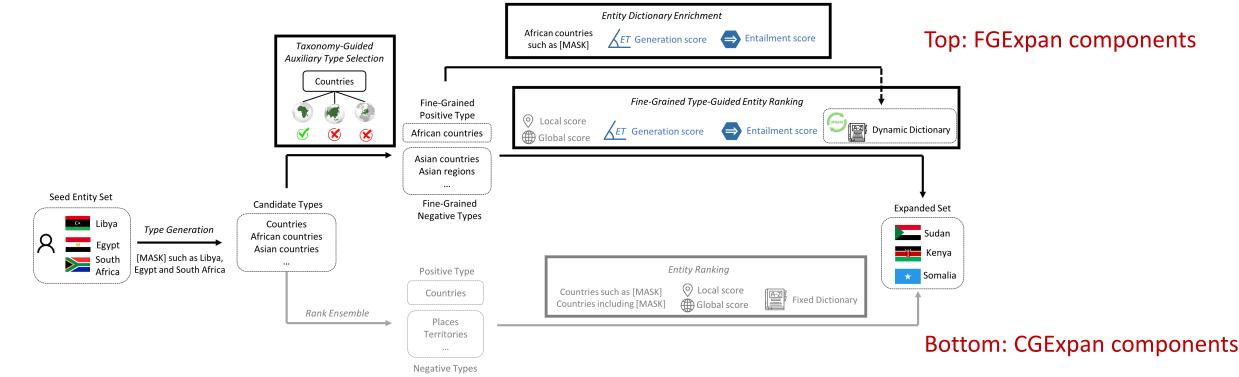

## **FGExpan: Fine-Grained Type Inference**

- Combine three scores to infer the fine-grained type of a seed set
  - **Entity generation score**: Generate entities for each type and compare to the seed set
  - □ Type generation score: Generate types for seeds and compare to the taxonomy
  - Entailment score: Test if the types are supported by the corpus context

# **FGExpan: Taxonomy-Guided Expansion**

- Taxonomy-guided auxiliary type selection: Use the type taxonomy to sharpen the distinctiveness between positive and negative types
- **Entity dictionary enrichment**: Dynamically add new entities to the vocabulary
- Fine-grained type-guided entity ranking: Use generation and entailment scores to tighten the semantic boundary of fine-grained types

### **FGExpan: Quantitative Results**

#### Prevents critical failures due to semantic drifts in the inferred type of the entity set

| Table 3: Fine-Grained Set Expansion Results   |                         |                    |                          |         |  |  |  |  |  |  |

- Named Entity Recognition
- Taxonomy Construction
  - **Taxonomy Basics and Construction**
  - Set Expansion
  - Taxonomy Construction (with Minimal User Guidance)
  - Taxonomy Expansion & Enrichment
- Relation Extraction and Knowledge Graph Construction

# **Seed-Guided Topical Taxonomy Construction**

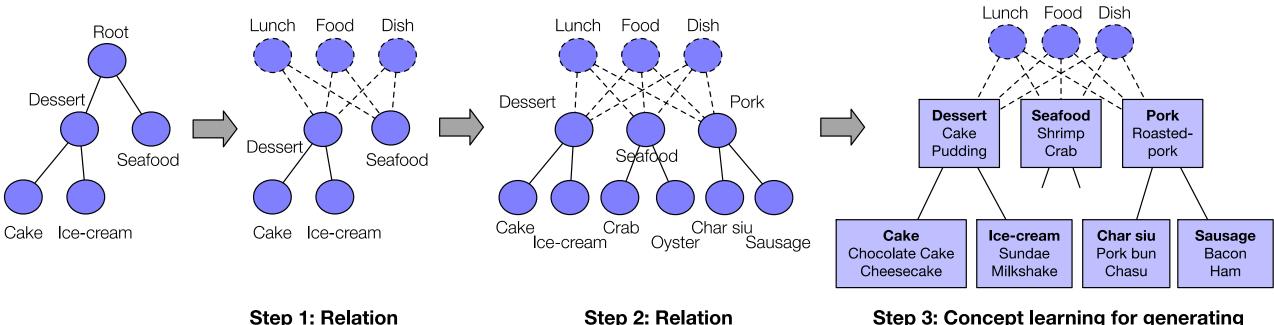

- User gives a seed taxonomy as guidance
- A more complete topical taxonomy is generated from text corpus, with each node represented by a cluster of terms (topics)

- A user might want to learn about concepts in a certain aspect (e.g., *food* or *research areas*) from a corpus
- He wants to know more about other kinds of food

User

#### CoRel: Seed-Guided Topical Taxonomy Construction by Concept Learning and Relation Transferring

Three Steps:

transferring upwards

Step 2: Relation transferring downwards

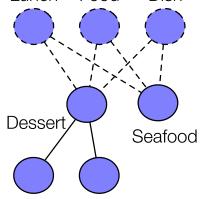

Step 3: Concept learning for generating topical clusters

- 1. Learn a relation classifier and transfer the relation upwards to **discover common root concepts** of existing topics
- 2. Transfer the relation downwards to find new topics/subtopics as child nodes of root/topics
- 3. Learn a discriminative embedding space to find distinctive terms for each concept node in the taxonomy

Jiaxin Huang, Yiqing Xie, Yu Meng, Yunyi Zhang and Jiawei Han, "CoRel: Seed-Guided Topical Taxonomy Construction by Concept Learning and Relation Transferring", KDD (2020)

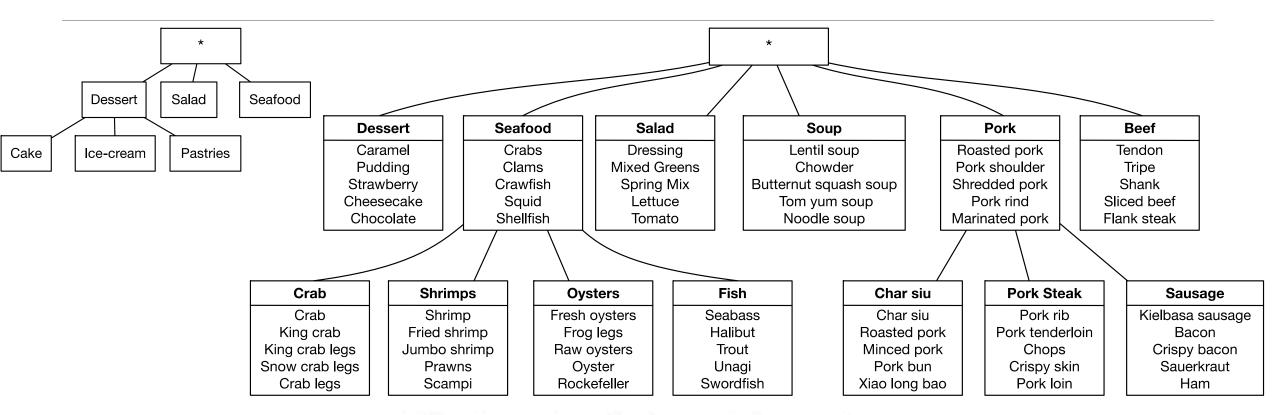

## **Relation Learning and Transferring**

- Learn a relation classifier using pretrained language model (e.g., BERT)
  - Using a weakly-supervised text embedding framework
- □ Transfer the relation upwards to discover possible root nodes (e.g., "Lunch" and "Food")
  - The root node would have more general contexts for us to find connections with potential new topics

- **C** Extract a list of parent nodes for each seed topic using the relation classifier
  - The common parent nodes shared by all user-given topics are treated as root nodes
- ☐ To discover new topics (e.g., Pork), we transfer the relation downwards from the root nodes

#### **Qualitative and Quantitative Results**

#### Table 5: Quantitative evaluation on topical taxonomies.

#### Outline

#### Phrase Mining

- Named Entity Recognition
- Taxonomy Construction
  - **Taxonomy Basics and Construction**
  - Set Expansion
  - Taxonomy Construction (with Minimal User Guidance)
  - Taxonomy Expansion & Enrichment
- Relation Extraction and Knowledge Graph Construction

### **Taxonomy Expansion: Motivation**

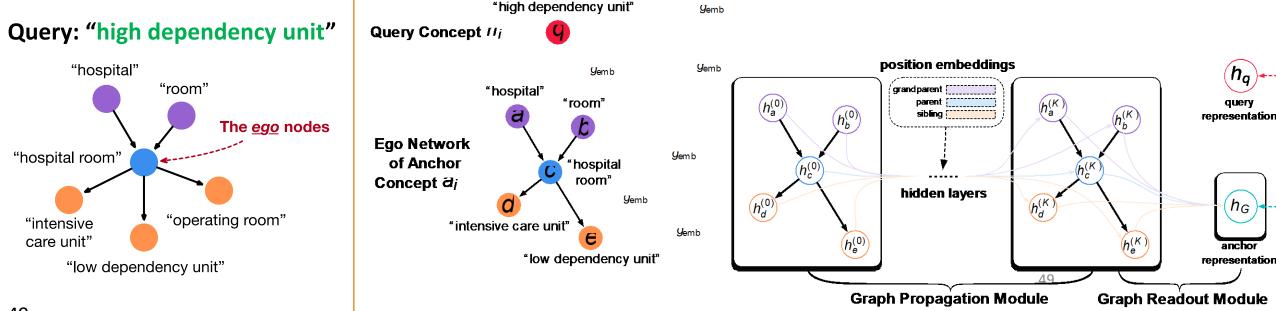

- Why taxonomy expansion instead of construction from scratch?
  - Already have a decent taxonomy built by experts and used in production
  - Most common terms are covered
  - New items (thus new terms) incoming everyday, cannot afford to rebuild the whole taxonomy frequently
  - Downstream applications require stable taxonomies to organize knowledge

#### TaxoExpan: Self-supervised Taxonomy Expansion with Position-Enhanced Graph Neural Network [WWW' 20]

- **Two steps** in solving the problem:
- Self-supervised term extraction
  - □ Automatically **extracts emerging terms** from a target domain
- Self-supervised term attachment
  - □ A multi-class classification to match a new node to its potential parent
  - Heterogenous sources of information (structural, semantic, and lexical) can be used

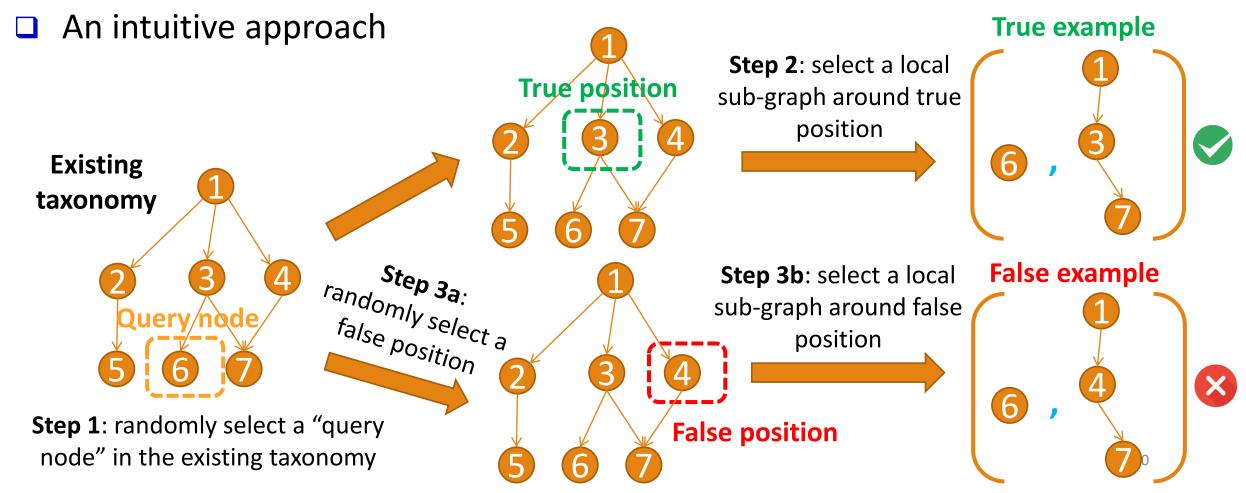

## **Self-supervised Term Attachment**

- TaxoExpan uses a matching score for each <query, anchor > pair to indicate how likely the anchor concept is the parent of query concept
- □ Key ideas:
  - Representing the anchor concept using its ego network (egonet)
  - Adding position information (relative to the *query concept*) into this egonet

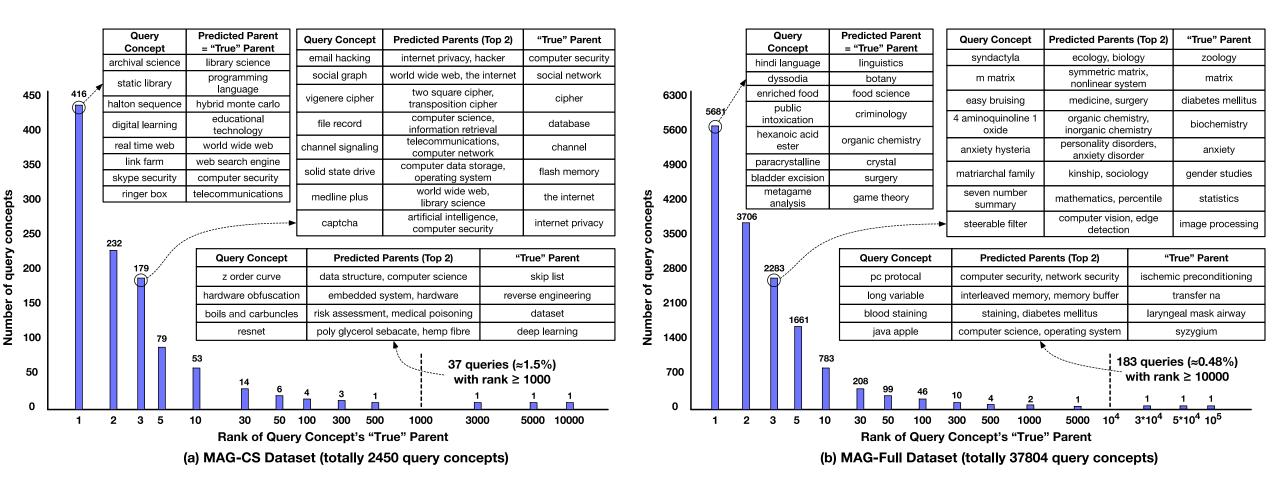

#### Leveraging Existing Taxonomy for Self-supervised Learning

How to learn model parameters without relying on massive humanlabeled data?

#### **TaxoExpan Framework Analysis**

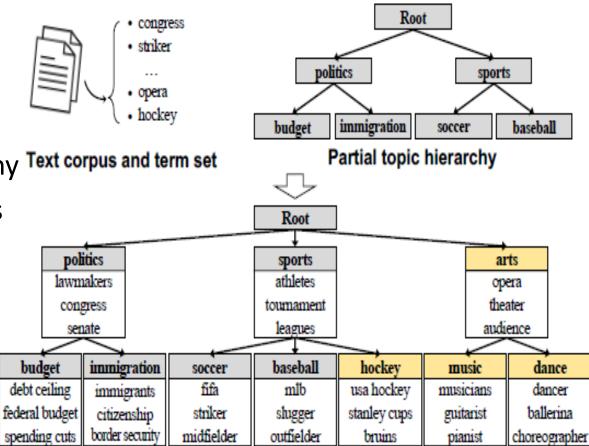

#### Case studies on MAG-CS and MAG-Full datasets

#### TaxoCom: Topic Taxonomy Completion with Hierarchical Discovery of Novel Topic Clusters

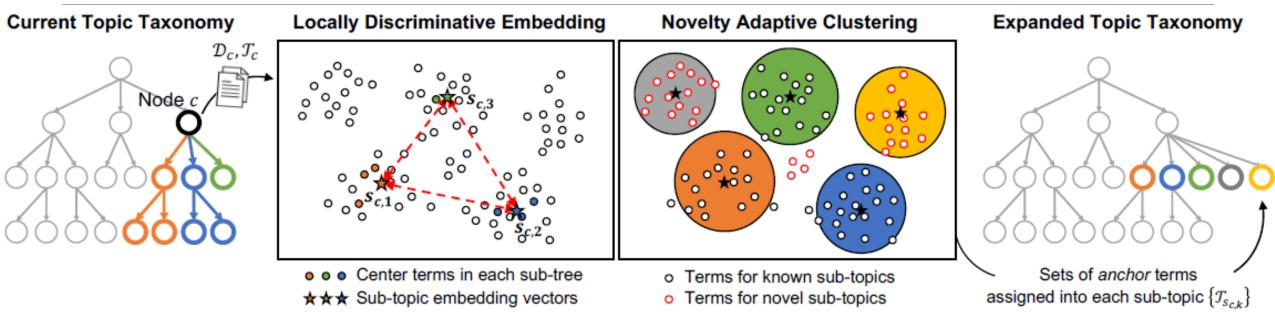

- □ Topic taxonomy completion: Task ≈ CoRel
- Results: Better quality than Corel
- Method:
  - Recursive expansion of a given topic hierarchy Text corpus and term set
  - Discovering novel sub-topic clusters of terms and documents

Dongha Lee, Jiaming Shen, SeongKu Kang, Susik Yoon, Jiawei Han, Hwanjo Yu, "TaxoCom: Topic Taxonomy Completion with Hierarchical Discovery of Novel Topic Clusters", WWW'22

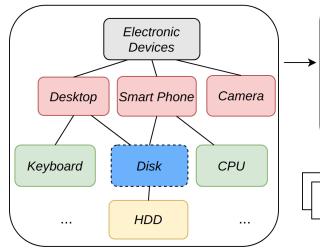

#### **TaxoCom: Hierarchical Discovery of Novel Topic Clusters**

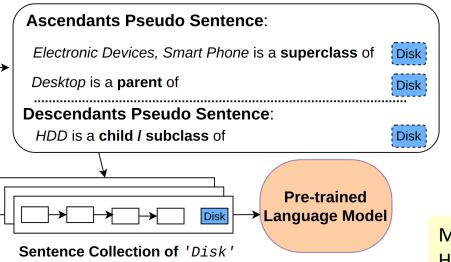

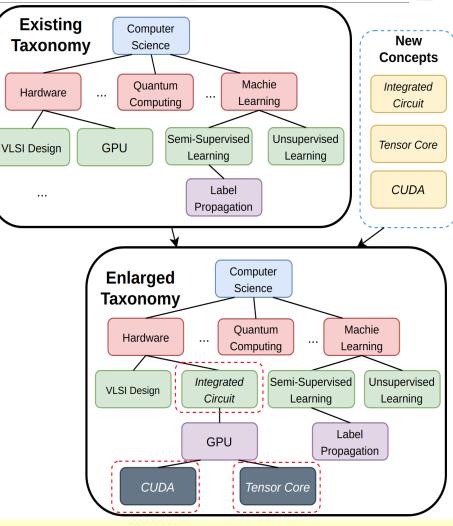

- Starting from the root node, it performs (i) locally discriminative embedding, and (ii) novelty adaptive clustering, to selectively assign the terms (of each node) into one of the child nodes
  - Locally discriminative embedding optimizes the text embedding space to be discriminative among known (i.e., given) sub-topics
  - Novelty adaptive clustering assigns terms into either one of the known sub-topics or novel sub-topics

#### TaxoEnrich: Self-Supervised Taxonomy Completion via Structure-Semantic Representations [WWW'22]

- Task: Inserting new concepts into an existing taxonomy
  - Find the relatedness between the concept and each candidate position
- How to capture extra semantic information?
  - Taxonomy-contextualized embedding
  - Layer-aware representation

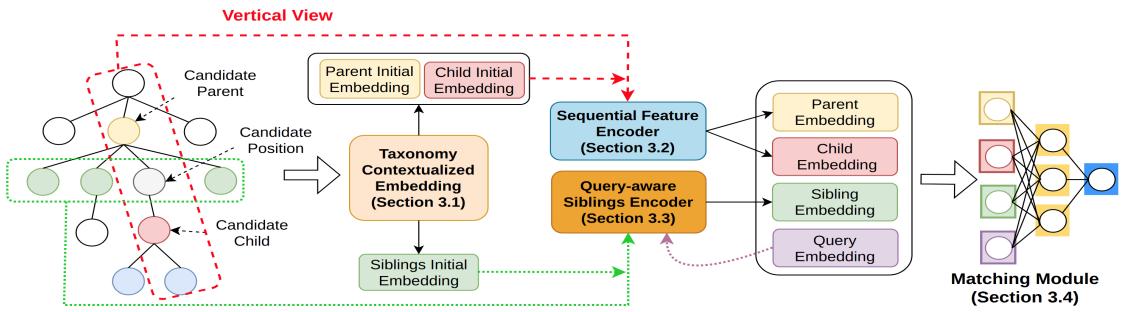

Minhao Jiang, Xiangchen Song, Jieyu Zhang and Jiawei Han, "TaxoEnrich: Self-Supervised Taxonomy Completion via Structure-Semantic Representations" (WWW'22)

### **TaxoEnrich: The General Framework**

#### **Horizontal View**

55

- Taxonomy-contextualized embedding which incorporates both semantic meanings of concept and taxonomic relations based on powerful pretrained language models
- A taxonomy-aware sequential encoder which learns candidate position representations by encoding the structural information of taxonomy
- A query-aware sibling encoder which adaptively aggregates candidate siblings to augment candidate position representations based on their importance to the query-position matching
- A query-position matching model which extends existing work with new candidate position representations

#### Outline

#### Phrase Mining

- Named Entity Recognition
- Taxonomy Construction
- Relation Extraction and Knowledge Graph Construction
  - Document-Based Relation Extraction
  - Automated Event Type Induction
  - Event Schema Discovery: Role Prediction

# **Document-Level Relation Extraction**

- Document-level relation extraction (DocRE)
  - Extract semantic relations among entity pairs in a document
- Blindly considering the full document?
  - A subset of the sentences in the doc ("evidence") should often be sufficient to identify the relation
- An evidence-enhanced DocRE framework: EIDER
  - Efficiently extracts evidence and effectively leverages the extracted evidence to improve DocRE
- Using a document-level relationship extraction dataset DocRED (2019)
- Relation extraction benefits natural language understanding in many ways
  - Ex. Knowledge graph construction

57

Head:Hero of the Day Tail:the United States Rel:[country of origin] GT evidence sentences: [1,10] Extracted evidence: [1,10]

Original document as input: [1] Load is the sixth studio album by the American heavy metal band Metallica, released on June 4, 1996 by Elektra Records in the United States ... [9] It was certified 5×platinum ... for shipping five million copies in the United States. [10] Four singles—"Hero of the Day", "Until It Sleeps", "Mama Said", and "King Nothing" — were released as part of the marketing campaign for the album. Prediction scores: NA: 17.63 country of origin: 14.79

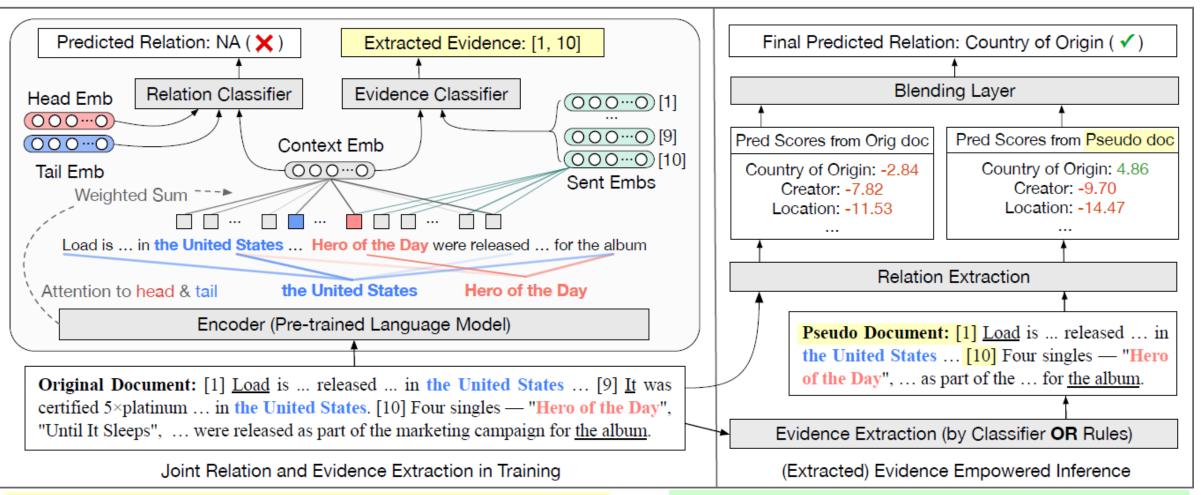

Extracted evidence as input:[1] Load is the sixth studioalbum... released ... in the United States... [10] Four singles— "Hero of the Day", ... were released ... for the album.Prediction scores:country of origin:18.31NA:13.45

  - Document-Based Relation Extraction
  - Automated Event Type Induction
  - Event Schema Discovery: Role Prediction

#### **New Event Type Representation**

- About 90% of event types can be frequently triggered by a predicate verb
  - "frequently triggered": The event type is triggered by verbs more than five times

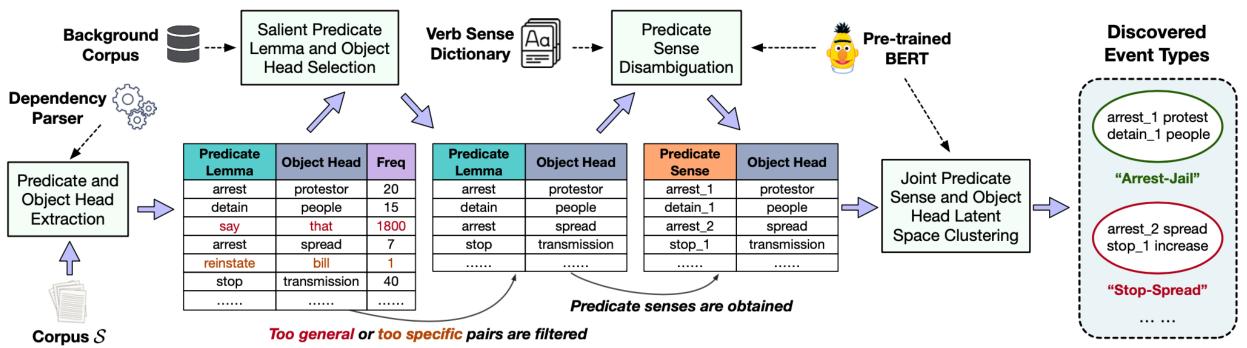

| Datasets                                   | ACE | ERE | RAMS |
|--|-----|-----|------|
| # of All Event Types                       | 33  | 38  | 138  |
| # of Verb Triggered Event Types            | 33  | 38  | 133  |
| # of Verb Frequently Triggered Event Types | 28  | 36  | 124  |

While predicate verbs could be ambiguous, their word senses combined with object heads can clearly indicate the event types
Represent an event type as a cluster

| ID | Sentences  | of <predicate head="" object="" sense,=""> (P-O) pairs</predicate>             |
|----|--|--|
| S1 | Hundreds of <i>people</i> are <b>detained</b> for distributing purported false information online.             | detain_1 people<br>arrest_1 people   |
| S2 | The Zimbabwe CTU said <u>69 <i>people</i></u> were <b>arrested</b> during Wednesday's demonstrations.          | "Arrest-Jail" stop_1 planning  |
| S3 | Researchers say that vaccinating 46 percent of Haitians could <b>arrest</b> the <u>cholera <i>spread</i></u> . | arrest_2 spread<br>stop_1 transmission "Stop-Plan"                             |
| S4 | Collective efforts are needed by all nations to <b>stop</b> the <u>COVID-19 <i>transmission</i></u> .          | "Stop-Spread"  |
| S5 | More censorship of social media posts are enforced to <b>stop</b> protest <i>planning</i> online.              | ETypeClus: Induce event types by<br>finding those P-O pair clusters [EMNLP'21] |

### **ETypeClus: Automated Event Type Induction**

- Step 1: Extract predicates and object heads from corpus (Use a dependency parser + a set of linguistic rules)
- **Step 2**: Select salient predicate lemmas and object heads
- **Step 3**: Disambiguate predicate senses
- **Step 4**: Cluster < predicate sense, object head> pairs in a latent spherical space

#### **Predicate Sense Disambiguation**

- Key idea: compare the usage of a predicate with each verb sense's example sentences in the verb sense dictionary
- □ How? Use the contextualization power of PLMs:
  - Continuous representation: hidden representation of the last layer
  - Discrete features: mask the target verb and let
     PLM predict the most possible replacements

#### Step 3.1a: Obtain BERT embedding

My dad's cousin was *executed* by the mafia for collaborating ...

 $[-0.234,\, 0.165,\, 1.564,\, -0.234,\, -0.557,\, 0.413,\, 0.165,\, 0.234...]$ 

| Execute; 3 senses  |
|--|
| Sense 1: Put to Death<br>Example 1: He was <u>executed</u> for murder.<br>Example 2: He is the first federal prisoner to be<br><u>executed</u> in 38 years.<br>Example 3: My dad's cousin was <u>executed</u> by the<br>mafia for collaborating with the police. |
| Sense 2: Do, Put to Effect<br>Example 1: We will see the deal <u>executed</u> as planned<br>Example 2: The whole play was <u>executed</u> with great<br>precision.<br>Example 3:I <u>executed</u> a program I had written many<br>times and got valid output.    |
| Sense 3: Sign a legal document before<br>witnesses<br>Example 1: The president executed the treaty.  |

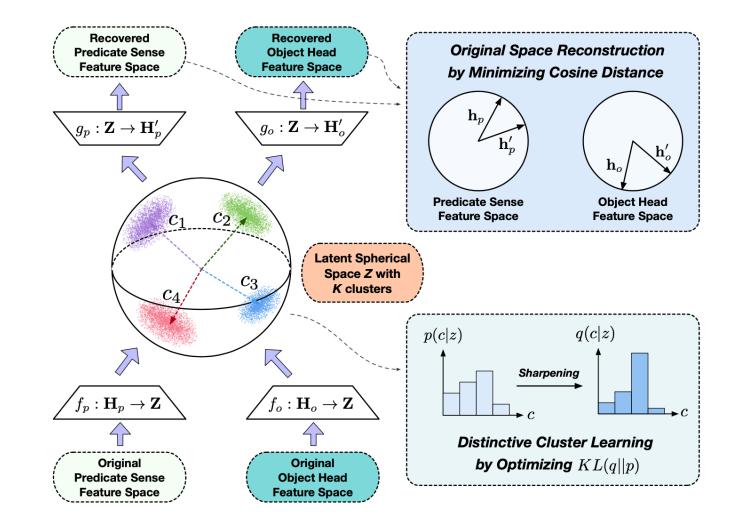

Step 3.1b: Obtain BERT masked prediction results

My dad's cousin was [MASK] by the mafia for collaborating ...

{killed: 0.66, wanted: 0.09, murdered: 0.04, executed: 0.02, ...}

#### Cluster <predicate sense, object head> pairs in a latent spherical space

- Joint Embedding and Clustering
  - We propose to jointly embed and cluster P-O pairs in a latent
     spherical space
  - The P-O pair embedding learning is guided by the clustering objective
  - The clustering quality is improved with the good structure of the latent space

# **Experiments on ACE and ERE Datasets**

#### Recover human-labeled event types

Identify **new types** and **finer-grained types** compared with human labeled ones

- Run ETypeClus to generate 100 candidate clusters
  - On ACE dataset, we recover 24 out 33 types (19 out of 20 most frequent types)
  - On ERE dataset, we recover 28 out 38 types (18 out of 20 most frequent types)

| Event Type         | Top Ranked P-O Pairs  | Example Sentences in Corpus  |
|--------------------|---|--|
| Arrest-Jail        | <pre> {arrest_0, protester} {arrest_0, militant} {arrest_0, suspect} </pre> | <ul> <li>For the most part the marches went off peacefully, but in New York a small group of <u>protesters</u> were <b>arrested</b> after they refused to go home at the end of their rally, police sources said.</li> <li>On Tuesday, Saudi security officials said three suspected al-Qaida <u>militants</u> were <b>arrested</b> in Jiddah, Saudi Arabia.</li> </ul>  |
| Build⊽             | <pre>{build_0, facility} {build_0, center} {build_0, housing}</pre>         | <ul> <li>Plans were underway to <b>build</b> destruction <i>facilities</i> at all other locations but now the Bush junta has removed from its proposed defense budget for fiscal year 2006 all but the minimum funding.</li> <li>Virginia is apparently going to be <b>build</b> a data <i>center</i> in Richmond, a back-up data center, and a help desk/call center as a follow-on to the creation of VITA, the Virginia Information Technology Agency.</li> </ul> |
| Transfer-Money     | <pre>{fund_0, activity&gt; {fund_0, operation&gt; {fund_0, people&gt;</pre> | <ul> <li>The grants will <b>fund</b> advisory <u>activities</u>, including local capacity building, infrastructure development and product development.</li> <li>The White House had hoped to hold off asking for more money to <b>fund</b> military <u>operations</u> in Iraq and Afghanistan until after the election, but with costs rising faster than expected, it sent a request for an early installment of \$25 billion to Congress this week.</li> </ul>    |
| Bombing $^{ abla}$ | <pre>{bomb_0, factory}</pre>  | <ul> <li>He bombed the Aspirin <i>factory</i> in 1998 (which turned out to have nothing to do with Bin Laden) the week he revealed he had been lying to us for eight months about Lewinsky.</li> <li>Prosecutors then also pointed to the men's suicide bomber training in 2011 in Somalia and association with Beledi, who prosecutors said bombed a government <u>checkpoint</u> in Mogadishu that year.</li> </ul>  |

#### **Experiments on Pandemic Dataset**

#### Outline

#### Phrase Mining

- Named Entity Recognition
- **Taxonomy Construction**
- Relation Extraction and Knowledge Graph Construction
  - **Document-Based Relation Extraction**
  - **Automated Event Type Induction**
  - Event Schema Discovery: Role Prediction

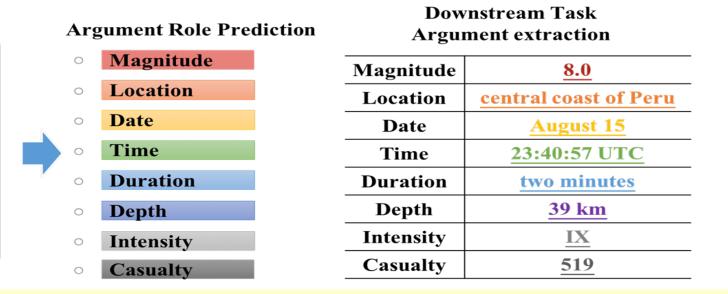

#### **Open-Vocabulary Argument Role Prediction**

#### □ Related Work:

- Most of existing studies rely on hand-crafted ontologies (costly, cannot generalize)
- A few studies try to automatically induce argument roles (limited pre-defined glossary)
- New Task: Infer a set of argument role names for a given event type to describe the crucial relations between the event type and its arguments

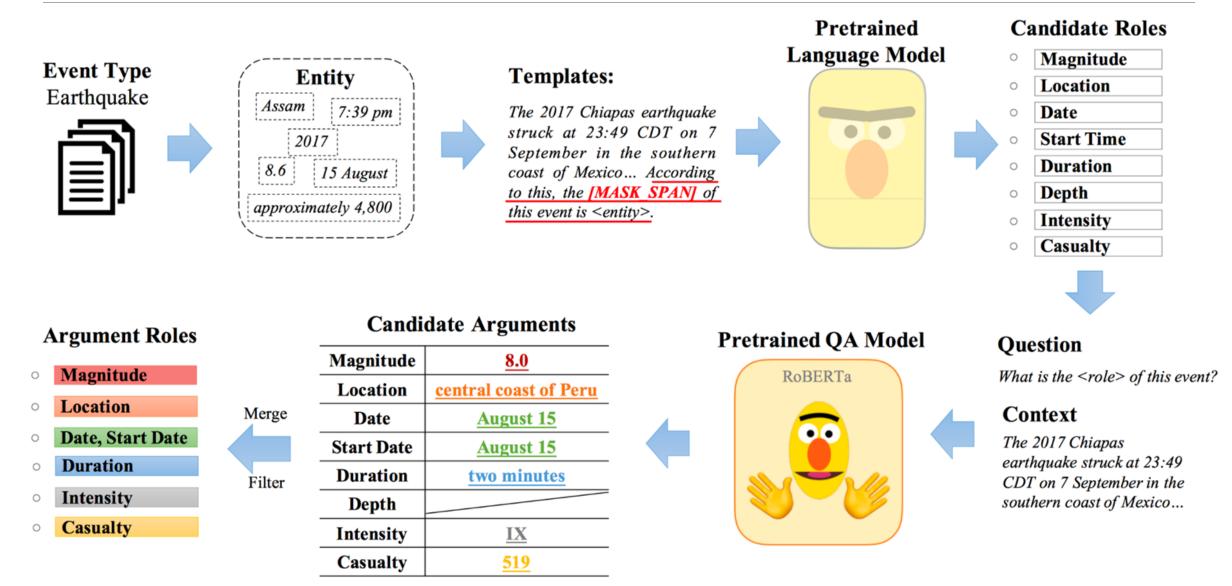

#### **Event Type: Earthquake**

The 2007 Peru earthquake, which measured 8.0 on the moment magnitude scale, hit the <u>central coast of Peru</u> on <u>August 15</u> at 23:40:57 UTC (18:40:57 local time) and lasted <u>two minutes</u>. The epicenter was located 150 km (93 mi) south-southeast of Lima at a depth of 39 <u>km</u> (24 mi). The United States Geological Survey National Earthquake Information Center reported that it had a maximum Mercalli intensity of <u>IX</u>. The Peruvian government stated that <u>519</u> people were killed by the quake.

Yizhu Jiao, Sha Li, Yiqing Xie, Ming Zhong, Heng Ji and Jiawei Han "Open-Vocabulary Argument Role Prediction for Event Extraction", EMNLP'22

#### Framework for RolePred (Argument Role Prediction)

#### **RolePred 1: Candidate Role Generation**

- Predict candidate role names for named entities by casting it as a prompt-based in-filling task
- Prompt Construction: (using Generation Model : T5)
  - Context. According to this, the (MASK SPAN) of this Event Type is Entity.
- Ex. The 1964 Alaskan earthquake, also known as the Great Alaskan earthquake, occurred at 5:36 PM AKST on Good Friday, March 27. According to this, the (MASK SPAN) of this earthquake is 5:36 PM.
  - □ 〈MASK SPAN〉 is expected to be filled with *time* (or *start time*) as the argument role
- Considering the entity's general semantic type: person, location, number, etc., we slightly alter the prompt to fluently and naturally support the unmasking argument roles

| Entity Type | Prompt  | Prompt design for different entities |
|-------------|---|--------------------------------------|
| PERSON      | According to this, Entity play the role of (MASK SP                 | AN in this Event Type.               |
| LOCATION    | According to this, the (MASK SPAN) is Entity i                      | n this Event Type.                   |
| NUMBER      | According to this, the number of $\langle MASK SPAN \rangle$ of the | is Event Type is Entity.             |
| OTHER TYPES | According to this, the $\langle MASK SPAN \rangle$ of this Eve      | ent Type is Entity.                  |

#### **RolePred 2: Candidate Argument Extraction**

- **G** Formulate the argument extraction problem into question-answering task
- Input: follow a standard BERT-style format (Model: BERT based pretrained QA model)
  - [CLS] What is the Event Role in this Event Type event? [SEP] Document [SEP]
- Ex. [CLS] What is the <u>casualty</u> in this <u>pandemic</u> event? [SEP] The COVID-19 pandemic is an ongoing global pandemic of coronavirus disease. It's estimated that the worldwide total number of deaths has exceeded five million ... [SEP]
  - □ The argument is expected to be five million
  - Note that, for some roles, a given document may not mention its argument. That is, the above-constructed question can be unanswerable. Thus, for each extracted answer, we set a threshold on its probability from the QA model to filter out some unreliable results.
- Benefit
- Widely adaptable to any argument role or event type
- Judge if some arguments exist
- Search for arguments in a document (not within a sentence)

#### **RolePred 3: Argument Role Selection**

Role Filtering

- Judge the salience of an argument role by involving multiple event instances of the same type
  - **Ex.** *intensity* of the *earthquake* events; *host* for the *award ceremony* events
- A role name belongs to the event type only if most of the event instances have their associated argument
- Role Merging
  - Different roles can represent similar semantics and share the same arguments in an event
    - Ex. The *date, official date,* and *original date* may refer to the same day for a firework event
  - The semantic similarity of two roles is determined by the frequency that they share the same argument in the event instances
    - Ex. Given 10 instances of the firework event, if two roles, *date*, and *official date*, have the same day as their arguments in 5 instances, their similarity is 0.5

#### **Experiment: Argument Role Prediction**
